DOCUMENT-IDENTIFIER: US 6501516 B1

TITLE: Remotely controlling video display devices

Detailed Description Text (5):

The remote control unit 22 may include a variety of buttons indicated at 23, 24 and 27 for generating wireless signals from the transceiver 26. These signals are received by the transceivers 16 and 18 to control the operation of the set-top box 12 or the television receiver 14 respectively. The resulting control signals produced by the transceiver 26 may be simple television control signals, such as "adjust volume", "change channel", or "turn the television receiver 14 on" or "off". In addition, the commands may be complex textual inputs to control the set-top box 12 to implement conventional computer systems including navigating the Internet, initiating a purchase transaction, or providing information to a variety of forms, as a few examples.

Apr 18, 2000

DOCUMENT-IDENTIFIER: US 6052239 A  
TITLE: Portable display device

Detailed Description Text (9):

A portable display device according to claim 12 is characterized by further comprising operation means (for example, an operation button 3 or the like shown in FIG. 9) operated when the change means is controlled.

Detailed Description Text (15):

On the cover 2, an operation button 3 for outputting commands for various processes to the portable display device and inputting required information and an assembly knob 4 for opening the cover 2 are arranged. The cover 2 is supported on the housing 1 by a cover pin 13 such that the cover 2 is pivoted (opened/closed) about the cover pin 13 as a center.

Detailed Description Text (88):

Here, a distance to the virtual image and the size of the virtual image can also be set such that a user operates the operation button 3. However, for example, the user can also cause the image signal processor 22 to set (control) the distance and the size in accordance with an image supplied to the device.

Detailed Description Text (100):

The motor drive circuit 43 is designed to rotatively drive an virtual image distance control motor 45 according to the m image distance control signal from the virtual image distance control computer 42. In addition, the motor drive circuit 43 is also designed to rotatively drive the virtual image distance control motor 45 according to an operation signal supplied by operating the operation button 3. When both the virtual image distance control signal and the operation signal are supplied, the motor drive circuit 43 gives priority to one of these signals, e.g., the operation signal.

Detailed Description Text (101):

The display controller 44 is designed in the following manner. That is, the lateral and longitudinal lengths of left-eye and right-eye image signals supplied from the image signal processing computer 41 are limited (magnified or reduced) according to a size control signal supplied from the image signal processing computer 41, and these signals are supplied to the display panels 12L and 12R to be displayed thereon. In addition, the display controller 44 is designed to magnify or reduce an image signal according to an operation signal supplied by operating the operation button 3. As in the motor drive circuit 43, when both a size control signal and an operation signal are supplied to the display controller 44, the display controller 44 gives priority to one of these signals, e.g., the operation signal.

Detailed Description Text (118):

An image to be displayed on the display panel 12 can be entirely magnified or reduced, and can be partially magnified or reduced. In addition, the image is magnified or reduced in only one direction of the lateral and longitudinal directions of the image, so that the aspect ratio of the image can be converted into a desired value. For example, when the image shows a landscape, the image is magnified in only the lateral direction to form an virtual image which is long in the lateral direction. In this manner, the feeling of surrounding can be given to the user.

Detailed Description Text (123):

In this embodiment, the distance to an virtual image or the like is changed in accordance with an image. However, as described above, the distance can also be changed by operating the operation button 3.

Detailed Description Text (153):

More specifically, in the fifth embodiment, in addition to an operation button 3, a display panel 70 is arranged on a cover 2. The display panel 70 is designed to display the same images as those displayed on the display panels 12L and 12R (not shown in FIG. 15) accommodated in a housing 1. Therefore, even if the cover 2 is not opened, a user can check the contents of information by displaying the information on the display panel 70.

Detailed Description Text (160):

On the front surface of the housing 81, the mirror cover 84, an operation button 82 for outputting commands of various processes to the portable display device or inputting required information, and a loudspeaker 83 for outputting voice are sequentially arranged from the upper portion of the housing 81.

Detailed Description Text (189):

In the portable display device arranged as described above, for example, when the operation button 82 is operated to access a predetermined information processing device, an operation signal corresponding to the operation is supplied to the central processing unit 205. In this case, the central processing unit 205 controls the communication function unit 201 through the signal switching controller 204 to cause the communication function unit 201 to access a predetermined information processing device. In this manner, when an image signal is transmitted from the predetermined information processing device, the image signal is received by the communication function unit 201 and supplied to the central processing unit 205 through the signal switching controller 204. The central processing unit 205 temporarily stores the image signal in the RAM 206, and then supplies the image signal to the video image display unit controller 209. When the video image display unit controller 209 receives an image signal from the central processing unit 205, the video image display unit controller 209 temporarily stores the image signal in the frame memory 208. The video image display unit controller 209 reads the image signal stored in the frame memory 208 at a necessary timing, and supplies the image signal to the video image display unit 210 to display the image signal.
